Contents

Preface	xiii
CHAPTER 1 Introduction to Digital Signal Processing	1
1.1. Basic Concepts of Digital Signal Processing.....	1
1.2. Basic Digital Signal Processing Examples in Block Diagrams	3
1.2.1. Digital Filtering	3
1.2.2. Signal Frequency (Spectrum) Analysis.....	3
1.3. Overview of Typical Digital Signal Processing in Real-World Applications	5
1.3.1. Digital Crossover Audio System.....	5
1.3.2. Interference Cancellation in Electrocardiography	5
1.3.3. Speech Coding and Compression.....	7
1.3.4. Compact-Disc Recording System	7
1.3.5. Vibration Signature Analysis for Defective Gear Teeth.....	9
1.3.6. Digital Photo Image Enhancement	9
1.4. Digital Signal Processing Applications.....	12
1.5. Summary	13
CHAPTER 2 Signal Sampling and Quantization	15
2.1. Sampling of Continuous Signal.....	15
2.2. Signal Reconstruction	21
2.2.1. Practical Considerations for Signal Sampling: Anti-Aliasing Filtering.....	25
2.2.2. Practical Considerations for Signal Reconstruction: Anti-Image Filter and Equalizer	30
2.3. Analog-to-Digital Conversion, Digital-to-Analog Conversion, and Quantization.....	35
2.4. Summary	47
2.5. MATLAB Programs.....	48
2.6. Problems	49
CHAPTER 3 Digital Signals and Systems.....	57
3.1. Digital Signals	57
3.1.1. Common Digital Sequences	58
3.1.2. Generation of Digital Signals.....	61
3.2. Linear Time-Invariant, Causal Systems	63
3.2.1. Linearity.....	63
3.2.2. Time Invariance	65
3.2.3. Causality	66
3.3. Difference Equations and Impulse Responses	67
3.3.1. Format of the Difference Equation	67
3.3.2. System Representation Using Its Impulse Response.....	68

3.4.	Bounded-In and Bounded-Out Stability	71
3.5.	Digital Convolution	72
3.6.	Summary	79
3.7.	Problem	80
CHAPTER 4	Discrete Fourier Transform and Signal Spectrum	87
4.1.	Discrete Fourier Transform	87
4.1.1.	Fourier Series Coefficients of Periodic Digital Signals.....	88
4.1.2.	Discrete Fourier Transform Formulas.....	91
4.2.	Amplitude Spectrum and Power Spectrum	97
4.3.	Spectral Estimation Using Window Functions	107
4.4.	Application to Signal Spectral Estimation.....	116
4.5.	Fast Fourier Transform	123
4.5.1.	Decimation-in-Frequency Method	123
4.5.2.	Decimation-in-Time Method.....	128
4.6.	Summary	132
4.7.	Problem.....	132
CHAPTER 5	The z-Transform	137
5.1.	Definition	137
5.2.	Properties of the z-Transform.....	140
5.3.	Inverse z-Transform.....	144
5.3.1.	Partial Fraction Expansion Using MATLAB	150
5.4.	Solution of Difference Equations Using the z-Transform	152
5.5.	Summary	156
5.6.	Problems	156
CHAPTER 6	Digital Signal Processing Systems, Basic Filtering Types, and Digital Filter Realizations	161
6.1.	The Difference Equation and Digital Filtering	161
6.2.	Difference Equation and Transfer Function.....	166
6.2.1.	Impulse Response, Step Response, and System Response.....	169
6.3.	The z-Plane Pole-Zero Plot and Stability	172
6.4.	Digital Filter Frequency Response	178
6.5.	Basic Types of Filtering	186
6.6.	Realization of Digital Filters	192
6.6.1.	Direct-Form I Realization	193
6.6.2.	Direct-Form II Realization	193
6.6.3.	Cascade (Series) Realization.....	195
6.6.4.	Parallel Realization.....	196
6.7.	Application: Signal Enhancement and Filtering	199
6.7.1.	Pre-Emphasis of Speech	200
6.7.2.	Bandpass Filtering of Speech.....	203
6.7.3.	Enhancement of ECG Signal Using Notch Filtering.....	205

6.8. Summary	206
6.9. Problem	208
CHAPTER 7 Finite Impulse Response Filter Design.....	217
7.1. Finite Impulse Response Filter Format	217
7.2. Fourier Transform Design	219
7.3. Window Method	230
7.4. Applications: Noise Reduction and Two-Band Digital Crossover	253
7.4.1. Noise Reduction	253
7.4.2. Speech Noise Reduction.....	256
7.4.3. Noise Reduction in Vibration Signals.....	257
7.4.4. Two-Band Digital Crossover.....	258
7.5. Frequency Sampling Design Method.....	262
7.6. Optimal Design Method	269
7.7. Realization Structures of Finite Impulse Response Filters.....	280
7.7.1. Transversal Form	280
7.7.2. Linear Phase Form.....	281
7.8. Coefficient Accuracy Effects on Finite Impulse Response Filters.....	282
7.9. Summary of FIR Design Procedures and Selection of FIR Filter Design Methods in Practice	285
7.10. Summary.....	288
7.11. MATLAB Programs	288
7.12. Problems	290
CHAPTER 8 Infinite Impulse Response Filter Design.....	301
8.1. Infinite Impulse Response Filter Format.....	302
8.2. Bilinear Transformation Design Method	303
8.2.1. Analog Filters Using Lowpass Prototype Transformation	304
8.2.2. Bilinear Transformation and Frequency Warping	308
8.2.3. Bilinear Transformation Design Procedure	314
8.3. Digital Butterworth and Chebyshev Filter Designs.....	318
8.3.1. Lowpass Prototype Function and Its Order	318
8.3.2. Lowpass and Highpass Filter Design Examples.....	322
8.3.3. Bandpass and Bandstop Filter Design Examples	331
8.4. Higher-Order Infinite Impulse Response Filter Design Using the Cascade Method.....	338
8.5. Application: Digital Audio Equalizer	341
8.6. Impulse-Invariant Design Method.....	345
8.7. Pole-Zero Placement Method for Simple Infinite Impulse Response Filters	351
8.7.1. Second-Order Bandpass Filter Design	352
8.7.2. Second-Order Bandstop (Notch) Filter Design.....	354
8.7.3. First-Order Lowpass Filter Design.....	355
8.7.4. First-Order Highpass Filter Design.....	357

8.8.	Realization Structures of Infinite Impulse Response Filters	358
8.8.1.	Realization of Infinite Impulse Response Filters in Direct-Form I and Direct-Form II.....	358
8.8.2.	Realization of Higher-Order Infinite Impulse Response Filters via the Cascade Form	361
8.9.	Application: 60-Hz Hum Eliminator and Heart Rate Detection Using Electrocardiography	362
8.10.	Coefficient Accuracy Effects on Infinite Impulse Response Filters	369
8.11.	Application: Generation and Detection of DTMF Tones Using the Goertzel Algorithm.....	373
8.11.1.	Single-Tone Generator	374
8.11.2.	Dual-Tone Multifrequency Tone Generator.....	375
8.11.3.	Goertzel Algorithm	377
8.11.4.	Dual-Tone Multifrequency Tone Detection Using the Modified Goertzel Algorithm	383
8.12.	Summary of Infinite Impulse Response (IIR) Design Procedures and Selection of the IIR Filter Design Methods in Practice	388
8.13.	Summary.....	391
8.14.	Problem.....	392
CHAPTER 9	Hardware and Software for Digital Signal Processors	405
9.1.	Digital Signal Processor Architecture.....	406
9.2.	Digital Signal Processor Hardware Units	408
9.2.1.	Multiplier and Accumulator	408
9.2.2.	Shifters	409
9.2.3.	Address Generators.....	409
9.3.	Digital Signal Processors and Manufacturers	411
9.4.	Fixed-Point and Floating-Point Formats	411
9.4.1.	Fixed-Point Format.....	412
9.4.2.	Floating-Point Format.....	419
9.4.3.	IEEE Floating-Point Formats	423
9.4.5.	Fixed-Point Digital Signal Processors	426
9.4.6.	Floating-Point Processors.....	427
9.5.	Finite Impulse Response and Infinite Impulse Response Filter Implementations in Fixed-Point Systems.....	429
9.6.	Digital Signal Processing Programming Examples	434
9.6.1.	Overview of TMS320C67x DSK.....	434
9.6.2.	Concept of Real-Time Processing.....	438
9.6.3.	Linear Buffering	440
9.6.4.	Sample C Programs	445
9.7.	Summary	448
9.8.	Problems	449

CHAPTER 10	Adaptive Filters and Applications	453
10.1.	Introduction to Least Mean Square Adaptive Finite Impulse Response Filters	453
10.2.	Basic Wiener Filter Theory and Least Mean Square Algorithm.....	457
10.3.	Applications: Noise Cancellation, System Modeling, and Line Enhancement.....	462
10.3.1.	Noise Cancellation.....	462
10.3.2.	System Modeling	468
10.3.3.	Line Enhancement Using Linear Prediction	473
10.4.	Other Application Examples	476
10.4.1.	Canceling Periodic Interferences Using Linear Prediction	476
10.4.2.	Electrocardiography Interference Cancellation.....	476
10.4.3.	Echo Cancellation in Long-Distance Telephone Circuits.....	479
10.5.	Laboratory Examples Using the TMS320C6713 DSK.....	480
10.6.	Summary	485
10.7.	Problems.....	486
CHAPTER 11	Waveform Quantization and Compression.....	497
11.1.	Linear Midtread Quantization	497
11.2.	μ -law Companding	501
11.2.1.	Analog μ -Law Companding.....	501
11.2.2.	Digital μ -Law Companding.....	504
11.3.	Examples of Differential Pulse Code Modulation (DPCM), Delta Modulation, and Adaptive DPCM G.721.....	509
11.3.1.	Examples of Differential Pulse Code Modulation and Delta Modulation.....	509
11.3.2.	Adaptive Differential Pulse Code Modulation G.721.....	512
11.4.	Discrete Cosine Transform, Modified Discrete Cosine Transform, and Transform Coding in MPEG Audio	519
11.4.1.	Discrete Cosine Transform.....	519
11.4.2.	Modified Discrete Cosine Transform.....	522
11.4.3.	Transform Coding in MPEG Audio.....	525
11.5.	Laboratory Examples of Signal Quantization Using the TMS320C6713 DSK.....	528
11.6.	Summary	533
11.7.	MATLAB Programs.....	533
11.8.	Problems.....	548
CHAPTER 12	Multirate Digital Signal Processing, Oversampling of Analog-to-Digital Conversion, and Undersampling of Bandpass Signals	555
12.1.	Multirate Digital Signal Processing Basics.....	555
12.1.1.	Sampling Rate Reduction by an Integer Factor.....	556

12.1.2. Sampling Rate Increase by an Integer Factor	562
12.1.3. Changing the Sampling Rate by a Noninteger Factor L/M	567
12.1.4. Application: CD Audio Player	571
12.1.5. Multistage Decimation	574
12.2. Polyphase Filter Structure and Implementation	578
12.3. Oversampling of Analog-to-Digital Conversion	585
12.3.1. Oversampling and Analog-to-Digital Conversion Resolution	586
12.3.2. Sigma-Delta Modulation Analog-to-Digital Conversion	592
12.4. Application Example: CD Player	601
12.5. Undersampling of Bandpass Signals	603
12.6. Sampling Rate Conversion Using the TMS320C6713 DSK	608
12.7. Summary	613
12.8. Problems	613
CHAPTER 13 Subband- and Wavelet-Based Coding	621
13.1. Subband Coding Basics	621
13.2. Subband Decomposition and Two-Channel Perfect Reconstruction Quadrature Mirror Filter Bank	626
13.3. Subband Coding of Signals	635
13.4. Wavelet Basics and Families of Wavelets	638
13.5. Multiresolution Equations	650
13.6. Discrete Wavelet Transform	655
13.7. Wavelet Transform Coding of Signals	664
13.8. MATLAB Programs	668
13.9. Summary	672
13.10. Problems	673
CHAPTER 14 Image Processing Basics	683
14.1. Image Processing Notation and Data Formats	684
14.1.1. 8-Bit Gray Level Images	684
14.1.2. 24-bit Color Images	686
14.1.3. 8-Bit Color Images	687
14.1.4. Intensity Images	688
14.1.5. Red, Green, and Blue Components and Grayscale Conversion	688
14.1.6. MATLAB Functions for Format Conversion	690
14.2. Image Histogram and Equalization	692
14.2.1. Grayscale Histogram and Equalization	692
14.2.2. 24-Bit Color Image Equalization	695
14.2.3. 8-Bit Indexed Color Image Equalization	700
14.2.4. MATLAB Functions for Equalization	702
14.3. Image Level Adjustment and Contrast	704
14.3.1. Linear Level Adjustment	704
14.3.2. Adjusting the Level for Display	707
14.3.3. MATLAB Functions for Image Level Adjustment	707

14.4.	Image Filtering Enhancement.....	707
14.4.1.	Lowpass Noise Filtering.....	709
14.4.2.	Median Filtering	712
14.4.3.	Edge Detection.....	715
14.4.4.	MATLAB Functions for Image Filtering	718
14.5.	Image Pseudo-Color Generation and Detection.....	722
14.6.	Image Spectra	725
14.7.	Image Compression by Discrete Cosine Transform	728
14.7.1.	Two-Dimensional Discrete Cosine Transform.....	729
14.7.2.	Two-Dimensional JPEG Grayscale Image Compression Example ...	731
14.7.3.	JPEG Color Image Compression.....	735
14.7.4.	Image Compression Using Wavelet Transform Coding	738
14.8.	Creating a Video Sequence by Mixing Two Images	745
14.9.	Video Signal Basics	746
14.9.1.	Analog Video	747
14.9.2.	Digital Video.....	753
14.10.	Motion Estimation in Video	755
14.11.	Summary	757
14.12.	Problems	758
Appendix A: Introduction to the MATLAB Environment		767
Appendix B: Review of Analog Signal Processing Basics		775
Appendix C: Normalized Butterworth and Chebyshev Functions		805
Appendix D: Sinusoidal Steady-State Response of Digital Filters		813
Appendix E: Finite Impulse Response Filter Design Equations by the Frequency Sampling Design Method.....		817
Appendix F: Wavelet Analysis and Synthesis Equations		821
Appendix G: Some Useful Mathematical Formulas.....		825

Preface

Technology such as microprocessors, microcontrollers, and digital signal processors have become so advanced that they have had a dramatic impact on the disciplines of electronics engineering, computer engineering, and biomedical engineering. Engineers and technologists need to become familiar with digital signals and systems and basic digital signal processing (DSP) techniques. The objective of this book is to introduce students to the fundamental principles of these subjects and to provide a working knowledge such that they can apply DSP in their engineering careers.

The book is suitable for a two-semester course sequence at the senior level in undergraduate electronics, computer, and biomedical engineering technology programs. Chapters 1 to 8 provide the topics for a one-semester course, and a second course can complete the rest of the chapters. This textbook can also be used in an introductory DSP course in an undergraduate electrical engineering program at traditional colleges. Additionally, the book should be useful as a reference for undergraduate engineering students, science students, and practicing engineers.

The material has been tested for two consecutive courses in a signal processing sequence at Purdue University North Central in Indiana. With the background established from this book, students will be well prepared to move forward to take other upper-level courses that deal with digital signals and systems for communications and control.

The textbook consists of 14 chapters, organized as follows:

- Chapter 1 introduces concepts of DSP and presents a general DSP block diagram. Application examples are included.
- Chapter 2 covers the sampling theorem described in the time domain and frequency domain and also covers signal reconstruction. Some practical considerations for designing analog anti-aliasing lowpass filters and anti-image lowpass filters are included. The chapter ends with a section dealing with analog-to-digital conversion (ADC) and digital-to-analog conversion (DAC), as well as signal quantization and encoding.
- Chapter 3 introduces digital signals, linear time-invariant system concepts, difference equations, and digital convolutions.
- Chapter 4 introduces the discrete Fourier transform (DFT) and digital signal spectral calculations using the DFT. Methods for applying the DFT to estimate the spectra of various signals, including speech, seismic signals, electrocardiography data, and vibration signals, are demonstrated. The chapter ends with a section dedicated to illustrating fast Fourier transform (FFT) algorithms.
- Chapter 5 is devoted to the z-transform and difference equations.
- Chapter 6 covers digital filtering using difference equations, transfer functions, system stability, digital filter frequency responses, and implementation methods such as direct-form I and direct-form II.
- Chapter 7 deals with various methods of finite impulse response (FIR) filter design, including the Fourier transform method for calculating FIR filter coefficients, window method, frequency sampling design, and optimal design. Chapter 7 also includes applications that use FIR filters for noise reduction and digital crossover system design.

- Chapter 8 covers various methods of infinite impulse response (IIR) filter design, including the bilinear transformation (BLT) design, impulse-invariant design, and pole-zero placement design. Applications using IIR filters include audio equalizer design, biomedical signal enhancement, dual-tone multifrequency (DTMF) tone generation, and detection with the Goertzel algorithm.
- Chapter 9 introduces DSP architectures, software and hardware, and fixed-point and floating-point implementations of digital filters.
- Chapter 10 covers adaptive filters with applications such as noise cancellation, system modeling, line enhancement, cancellation of periodic interferences, echo cancellation, and 60-Hz interference cancellation in biomedical signals.
- Chapter 11 is devoted to speech quantization and compression, including pulse code modulation (PCM) coding, mu-law compression, adaptive differential pulse code modulation (ADPCM) coding, windowed modified discrete cosine transform (W-MDCT) coding, and MPEG audio format, specifically MP3 (MPEG-1, layer 3).
- Chapter 12 covers topics pertaining to multirate DSP and applications, as well as principles of oversampling ADC, such as sigma-delta modulation. Undersampling for bandpass signals is also examined.
- Chapter 13 introduces a subband coding system and its implementation. Perfect reconstruction conditions for a two-band system are derived. Subband coding with an application of data compression is demonstrated. Furthermore, the chapter covers the discrete wavelet transform (DWT) with applications to signal coding and denoising.
- Finally, Chapter 14 covers image enhancement using histogram equalization and filtering methods, including edge detection. The chapter also explores pseudo-color image generation and detection, two-dimensional spectra, JPEG compression using DCT, image coding using the DWT, and the mixing of two images to create a video sequence. Finally, motion compensation of the video sequence is explored, which is a key element of video compression used in MPEG.

MATLAB programs are listed whenever they are possible. Therefore, a MATLAB tutorial should be given to students who are new to the MATLAB environment.

- Appendix A serves as a MATLAB tutorial.
- Appendix B reviews key fundamentals of analog signal processing. Topics include Fourier series, Fourier transform, Laplace transform, and analog system basics.
- Appendixes C, D, and E review Butterworth and Chebyshev filters, sinusoidal steady-state responses in digital filters, and derivation of the FIR filter design equation via the frequency sampling method, respectively.
- Appendix F details the derivations of wavelet analysis and synthesis equations.
- Appendix G offers general useful mathematical formulas.

In this new edition, MATLAB projects dealing with practical applications are included in Chapters 2, 4, 6, 7, 8, 10, 12, and 13.

Instructor support, including solutions, can be found at <http://textbooks.elsevier.com>. MATLAB programs and exercises for students, plus Real-time C programs can be found at booksite.elsevier.com/9780124158931.

Thanks to all the faculty and staff at Purdue University North Central in Westville, Indiana, for their encouragement. In particular, the authors wish to thank Professors Thomas F. Brady, Larryl Matthews,

Christopher J. Smith, Alain Togbe, Edward Vavrek, Nuri Zeytinoglu, and Shengyong Zhang for their support and suggestions. We are also indebted to all former students in our DSP classes at Purdue University North Central for their feedback over the years, which helped refine this edition.

Special thanks go to Joseph P. Hayton (Publisher), Chelsea Johnston (Editorial Project Manager), and Renata Corbani (Project Manager) at Elsevier for their encouragement and guidance in developing the second edition.

The book has benefited from many constructive comments and suggestions from the following reviewers and anonymous reviewers. The authors take this opportunity to thank them for their significant contributions. We would like to thank the following reviewers for the second edition:

Professor Oktay Alkin, Southern Illinois University Edwardsville
Professor Rabah Aoufi, DeVry University-Irving, TX
Dr. Janko Calic, University of Surrey, UK
Professor Erik Cheever, Swarthmore College
Professor Samir Chettri, University of Maryland Baltimore County
Professor Nurgun Erdol, Florida Atlantic University
Professor Richard L. Henderson, DeVry University, Kansas City, MO
Professor JeongHee Kim, San Jose State University
Professor Sudarshan R. Nelatury, Penn State University, Erie, PA
Professor Javad Shakib, DeVry University in Pomona, California
Dr.ir. Herbert Wormeester, University of Twente, The Netherlands
Professor Yongpeng Zhang, Prairie View A&M University

In addition we would like to repeat our thanks to the reviewers for the first edition: Professor Mateo Aboy, Oregon Institute of Technology; Professor Jean Andrian, Florida International University; Professor Rabah Aoufi, DeVry University; Professor Larry Bland, John Brown University; Professor Phillip L. De Leon, New Mexico State University; Professor Mohammed Feknous, New Jersey Institute of Technology; Professor Richard L. Henderson, DeVry University; Professor Ling Hou, St. Cloud State University; Professor Robert C. (Rob) Maher, Montana State University; Professor Abdulmagid Omar, DeVry University; Professor Ravi P. Ramachandran, Rowan University; Professor William (Bill) Routt, Wake Technical Community College; Professor Samuel D. Stearns, University of New Mexico; Professor Les Thede, Ohio Northern University; Professor Igor Tsukerman, University of Akron; Professor Vijay Vaidyanathan, University of North Texas; and Professor David Waldo, Oklahoma Christian University.

1.3.4 Compact-Disc Recording System	7
1.3.5 Vibration Signature Analysis for Defective Gear Teeth	9
1.3.6 Digital Photo Image Enhancement	9
1.4 Digital Signal Processing Applications	12
1.5 Summary	13

OBJECTIVES:

This chapter introduces concepts of digital signal processing (DSP) and reviews an overall picture of its applications. Illustrative application examples include digital noise filtering, signal frequency analysis, speech and audio compression, biomedical signal processing such as interference cancellation in electrocardiography, compact-disc recording, and image enhancement.

1.1 BASIC CONCEPTS OF DIGITAL SIGNAL PROCESSING

Digital signal processing (DSP) technology and its advancements have dramatically impacted our modern society everywhere. Without DSP, we would not have digital/Internet audio and video; digital recording; CD, DVD, and MP3 players; iPhone and iPad; digital cameras; digital and cellular telephones; digital satellite and TV; or wired and wireless networks. Medical instruments would be less efficient or unable to provide useful information for precise diagnoses if there were no digital electrocardiography (ECG) analyzers, digital X-rays, and medical image systems. We would also live in many less efficient ways, since we would not be equipped with voice recognition systems, speech synthesis systems, and image and video editing systems. Without DSP, scientists, engineers, and technologists would have no powerful tools to analyze and visualize the data necessary for their designs, and so on.

FIGURE 1.1

A digital signal processing scheme.

The basic concept of DSP is illustrated by the simplified block diagram in Figure 1.1, which consists of an analog filter, an analog-to-digital conversion (ADC) unit, a digital signal (DS) processor, a digital-to-analog conversion (DAC) unit, and a reconstruction (anti-image) filter.

As shown in the diagram, the analog input signal, which is continuous in time and amplitude, is generally encountered in the world around us. Examples of such analog signals include current, voltage, temperature, pressure, and light intensity. Usually a transducer (sensor) is used to convert the nonelectrical signal to the analog electrical signal (voltage). This analog signal is fed to an analog filter, which is applied to limit the frequency range of analog signals prior to the sampling process. The purpose of filtering is to significantly attenuate *aliasing distortion*, which will be explained in the next chapter. The band-limited signal at the output of the analog filter is then sampled and converted via the ADC unit into the digital signal, which is discrete both in time and in amplitude. The DS processor then accepts the digital signal and processes the digital data according to DSP rules such as lowpass, highpass, and bandpass digital filtering, or other algorithms for different applications. Notice that the DS processor unit is a special type of digital computer and can be a general-purpose digital computer, a microprocessor, or an advanced microcontroller; furthermore, DSP rules can be implemented using software in general.

With the DS processor and corresponding software, a processed digital output signal is generated. This signal behaves in a manner according to the specific algorithm used. The next block in Figure 1.1, the DAC unit, converts the processed digital signal to an analog output signal. As shown, the signal is continuous in time and discrete in amplitude (usually a sample-and-hold signal, to be discussed in Chapter 2). The final block in Figure 1.1 is designated as a function to smooth the DAC output voltage levels back to the analog signal via a reconstruction (anti-image) filter for real-world applications.

In general, the analog signal process does not require software, an algorithm, ADC, and DAC. The processing relies wholly on the electrical and electronic devices such as resistors, capacitors, transistors, operational amplifiers, and integrated circuits (ICs).

DSP systems, on the other hand, use software, digital processing, and algorithms; thus they have a great deal of flexibility, less noise interference, and no signal distortion in various applications. However, as shown in Figure 1.1, DSP systems still require minimum analog processing such as the anti-aliasing and reconstruction filters, which are musts for converting real-world information into digital form and digital signals back into real-world information.

Note that there are many real-world DSP applications that do not require DAC, such as data acquisition and digital information display, speech recognition, data encoding, and so on. Similarly, DSP applications that need no ADC include CD players, text-to-speech synthesis, and digital tone generators, among others. We will review some of them in the following sections.

1.2 BASIC DIGITAL SIGNAL PROCESSING EXAMPLES IN BLOCK DIAGRAMS

We first look at digital noise filtering and signal frequency analysis, using block diagrams.

1.2.1 Digital Filtering

Let us consider the situation shown in Figure 1.2, depicting a digitized noisy signal obtained from digitizing analog voltages (sensor output) containing a useful low-frequency signal and noise that occupies all of the frequency range. After ADC, the digitized noisy signal $x(n)$, where n is the sample number, can be enhanced using digital filtering.

Since our useful signal contains the low-frequency component, the high-frequency components above that of our useful signal are considered noise, which can be removed by using a digital lowpass filter. We set up the DSP block in Figure 1.2 to operate as a simple digital lowpass filter. After processing the digitized noisy signal $x(n)$, the digital lowpass filter produces a clean digital signal $y(n)$. We can apply the cleaned signal $y(n)$ to another DSP algorithm for a different application or convert it to the analog signal via DAC and the reconstruction filter.

The digitized noisy signal and clean digital signal, respectively, are plotted in Figure 1.3, where the top plot shows the digitized noisy signal, while the bottom plot demonstrates the clean digital signal obtained by applying the digital lowpass filter. Typical applications of noise filtering include acquisition of clean digital audio and biomedical signals and enhancement of speech recording, among others (Embree, 1995; Rabinar and Schafer, 1978; Webster, 1998).

The simple digital filtering block.

1.2.2 Signal Frequency (Spectrum) Analysis

As shown in Figure 1.4, certain DSP applications often require that time domain information and the frequency content of the signal be analyzed. Figure 1.5 shows a digitized audio signal and its calculated signal spectrum (frequency content), that is, the signal amplitude versus its corresponding frequency for the time being, obtained from a DSP algorithm, called the *fast Fourier transform* (FFT), which will be studied in Chapter 4. The plot in Figure 1.5(a) is a time domain display of the recorded audio signal with a frequency of 1,000 Hz sampled at 16,000 samples per second, while the frequency content display of plot (b) displays the calculated signal spectrum versus frequency, in which the peak amplitude is clearly located at 1,000 Hz. Plot (c) shows a time domain display of an audio signal consisting of one signal of 1,000 Hz and another of 3,000 Hz sampled at 16,000 samples per second. The frequency content display shown in plot (d) gives two locations (1,000 Hz and 3,000 Hz) where the peak amplitudes reside, hence the frequency content display presents clear frequency information of the recorded audio signal.

FIGURE 1.4

Signal spectral analysis.

As another practical example, we often perform spectral estimation of a digitally recorded speech or audio (music) waveform using the FFT algorithm in order to investigate spectral frequency details of speech information. Figure 1.6 shows a speech signal produced by a human in the time domain and frequency content displays. The top plot shows the digital speech waveform versus its digitized sample number, while the bottom plot shows the frequency content information of speech for a range from 0 to 4,000 Hz. We can observe that there are about ten spectral peaks, called *speech formants*, in the range between 0 and 1,500 Hz. Those identified speech formants can be used for applications such as speech modeling, speech coding, speech feature extraction for speech synthesis and recognition, and so on (Deller et al., 1993).

Audio signals and their spectra.

1.3 OVERVIEW OF TYPICAL DIGITAL SIGNAL PROCESSING IN REAL-WORLD APPLICATIONS

1.3.1 Digital Crossover Audio System

An audio system is required to operate in an entire audible range of frequencies, which may be beyond the capability of any single speaker driver. Several drivers, such as the speaker cones and horns, each covering a different frequency range, are used to cover the full audio frequency range.

Figure 1.7 shows a typical two-band digital crossover system consisting of two speaker drivers: a woofer and a tweeter. The woofer responds to low frequencies, while the tweeter responds to high frequencies. The incoming digital audio signal is split into two bands by using a digital lowpass filter and a digital highpass filter in parallel. Then the separated audio signals are amplified. Finally, they are sent to their corresponding speaker drivers. Although the traditional crossover systems are designed using the analog circuits, the digital crossover system offers a cost-effective solution with programmability, flexibility, and high quality. This topic is taken up in Chapter 7.

1.3.2 Interference Cancellation in Electrocardiography

In ECG recording, there often is unwanted 60-Hz interference in the recorded data (Webster, 1998). The analysis shows that the interference comes from the power line and includes magnetic induction,

displacement currents in leads or in the body of the patient, effects from equipment interconnections, and other imperfections. Although using proper grounding or twisted pairs minimizes such 60-Hz effects, another effective choice can be use of a digital notch filter, which eliminates the 60-Hz interference while keeping all the other useful information. Figure 1.8 illustrates a 60-Hz interference eliminator using a digital notch filter. With such enhanced ECG recording, doctors in clinics could give accurate diagnoses for patients.

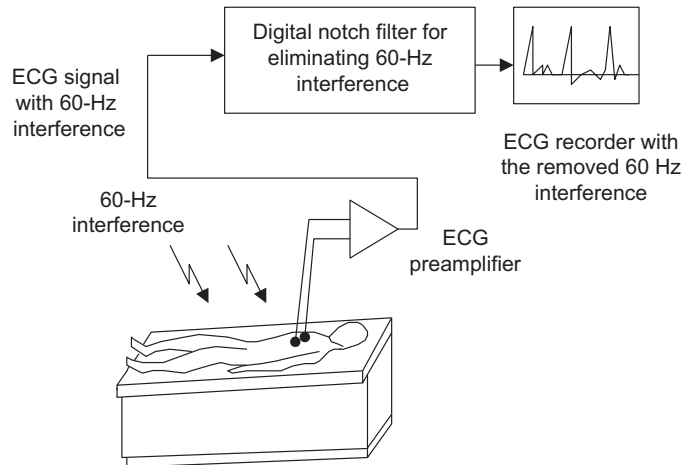

FIGURE 1.8

Elimination of 60-Hz interference in electrocardiography (ECG).

This technique can also be applied to remove 60-Hz interference in audio systems. This topic is explored in depth in Chapter 8.

1.3.3 Speech Coding and Compression

One of the speech coding methods, called *waveform coding*, is depicted in Figure 1.9A, describing the encoding process, while Figure 1.9B shows the decoding processing. As shown in Figure 1.9A, the analog signal is first sent through an analog lowpass filter to remove high frequency noise components and is then passed through the ADC unit, where the digital values at sampling instants are captured by the DS processor. Next, the captured data are compressed using data compression rules to reduce the storage requirements. Finally, the compressed digital information is sent to storage media. The compressed digital information can also be transmitted efficiently, since compression reduces the original data rate. Digital voice recorders, digital audio recorders, and MP3 players are products that use compression techniques (Deller et al., 1993; Li and Drew, 2004; Pan 1985).

To retrieve the information, the reverse process is applied. As shown in Figure 1.9B, the DS processor decompresses the data from the storage media and sends the recovered digital data to DAC. The analog output is acquired by filtering the DAC output via the reconstruction filter.

1.3.4 Compact-Disc Recording System

A compact-disc (CD) recording system is described in Figure 1.10A. The analog audio signal is sensed from each microphone and then fed to the anti-aliasing lowpass filter. Each filtered audio signal is sampled at the industry standard rate of 44.1 kilo-samples per second, quantized, and coded to 16 bits for each digital sample in each channel. The two channels are further multiplexed and encoded, and extra bits are added to provide information such as playing time and track number for the listener. The encoded
